Abstract: To address the problems of unclear basic data, different standards, irregular management, data islands, untime GDWDXSGDWHV DQG GLI¿FXOW VKDULQJ DQG FRRUGLQDWLRQ LQ XUE data, artificial intelligence, Internet of Things, GIS, CIM, BIM, and other technologies, and considering all space-time features of the subway structure and its surroundings, the overall architecture of the urban rail intelligent monitoring digita base, including the perception layer, network layer, computing and storage facility layer, data layer, service layer, and application layer, is proposed. The key technologies for building a digital base for smart monitoring are also discussed. Dat VWDQGDUGV DQG VSHFL¿FDWLRQV IRUP WKH EDVLV IRU EXLOGLQJ D G studied as pain points for intelligent monitoring of integrated geological information. Practical integration technologies VXFK DV WKH 2*& VWDQGDUG DQG *HR627 EDVHG RQ PXOWL VRXUFH K visualization technology for the BIM model was studied. Based on the attribute modeling technology, the fusion technology of the tunnel and 3D geological models was explored. Using ArcGIS, Java, and the Spring Cloud microservice framework a city's urban rail intelligent monitoring digital base was developed and applied for smart approval and O&M.

Key words: rail transit; intelligent operation and maintenance; digital base; three-dimensional geological model; GIS; BIM
